Content

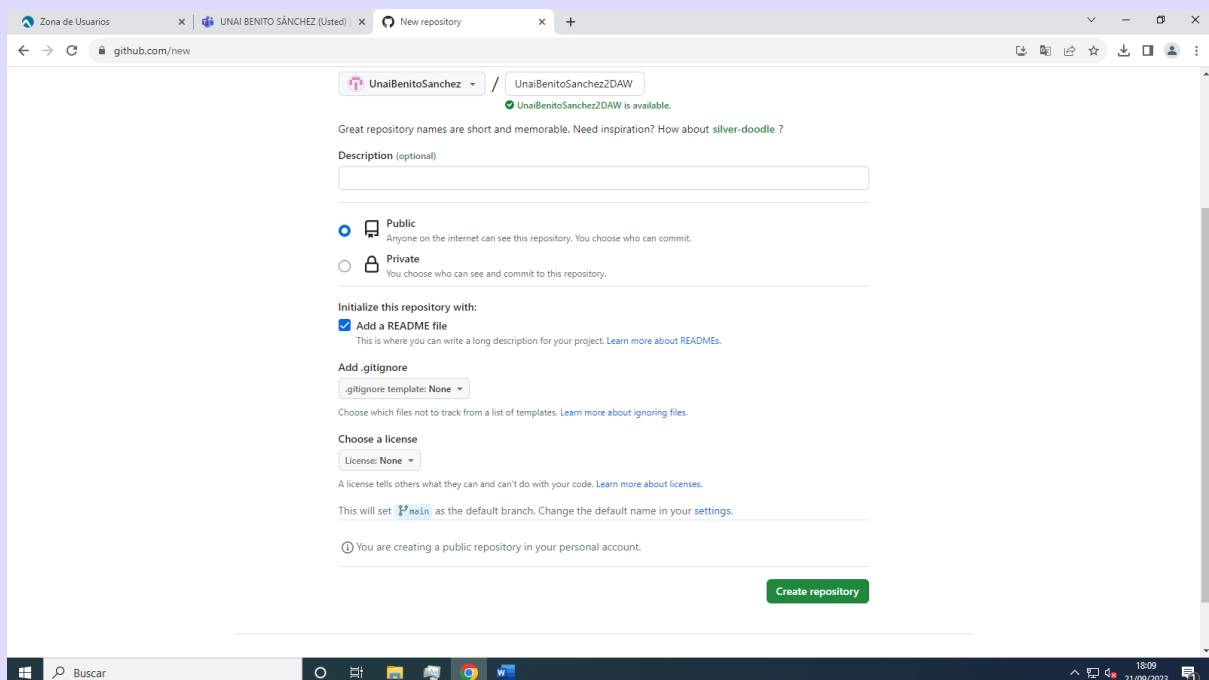

1.Create a repository for your site.	3
2. Create the site.....	4

1. Create a repository for your site.

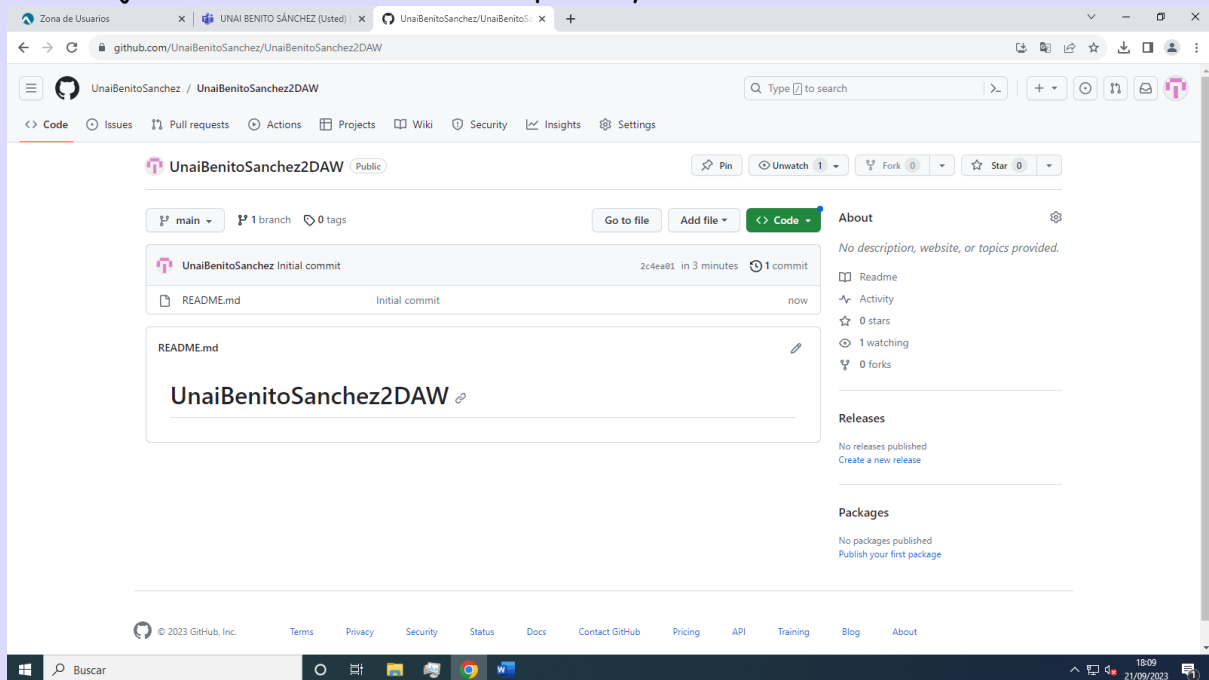

Once we are in GitHub, we must click on the + button in the upper right corner and click on "new repository".

We should give the repository a name, in this case it will be "UnaiBenitoSanchez2DAW".

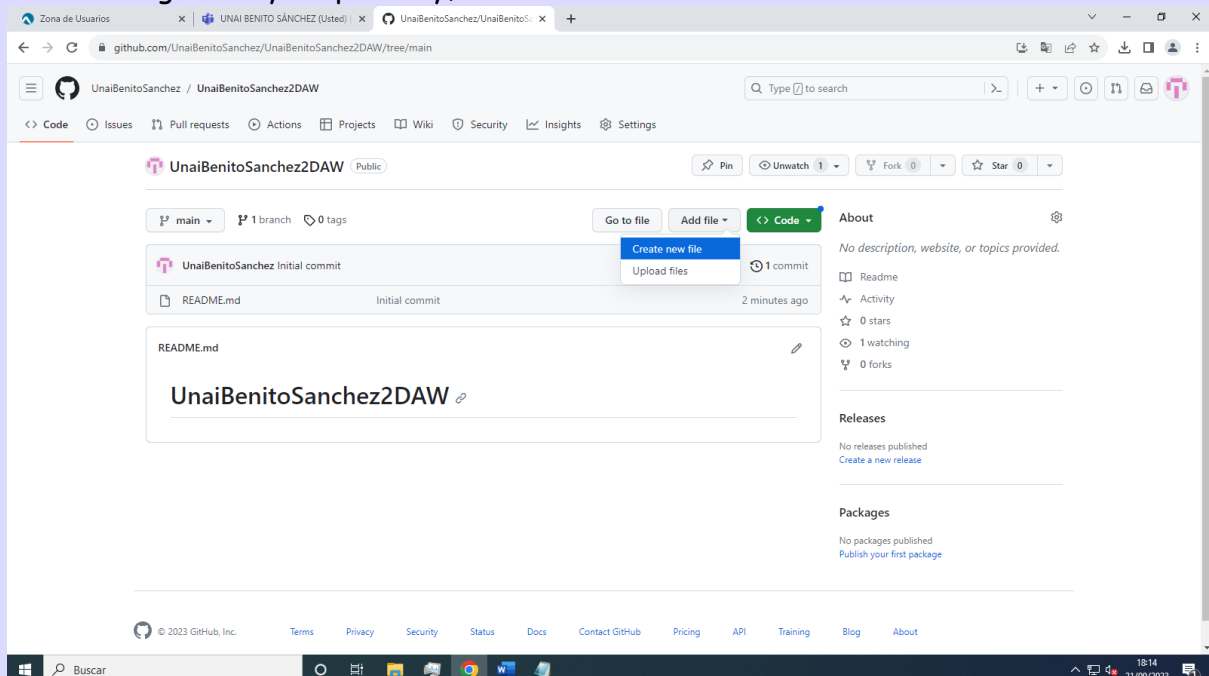

Now we just should click on "Create repository" and it will be created.

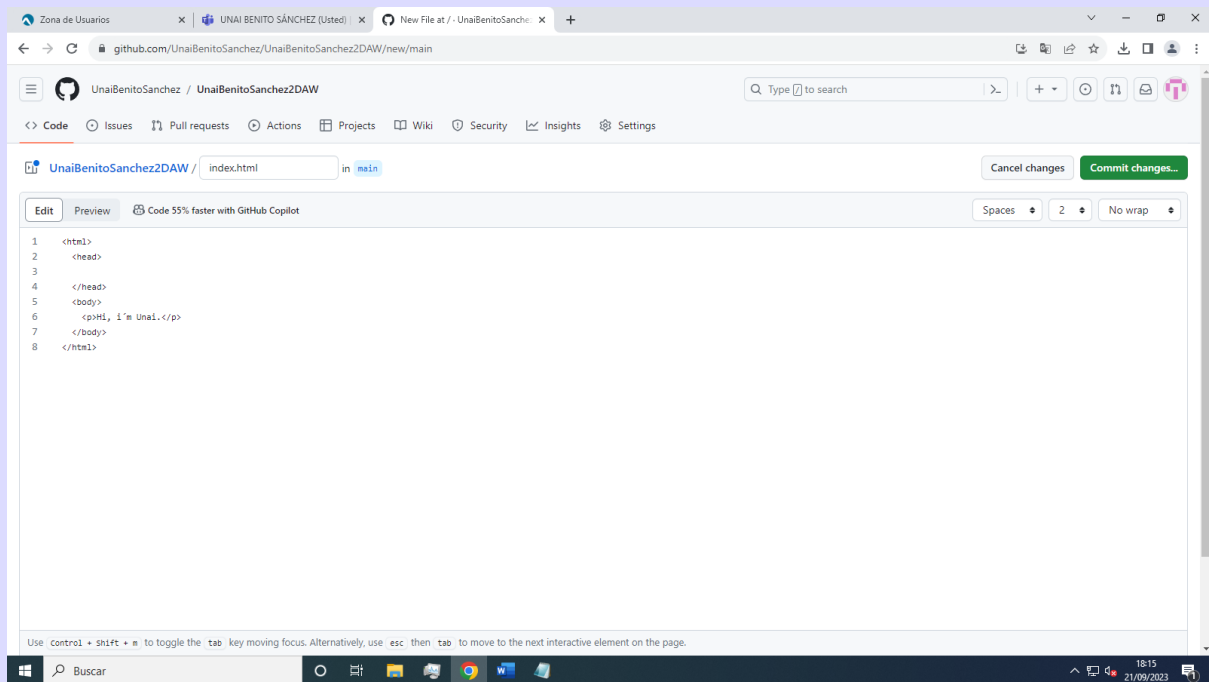

2. Create the site.

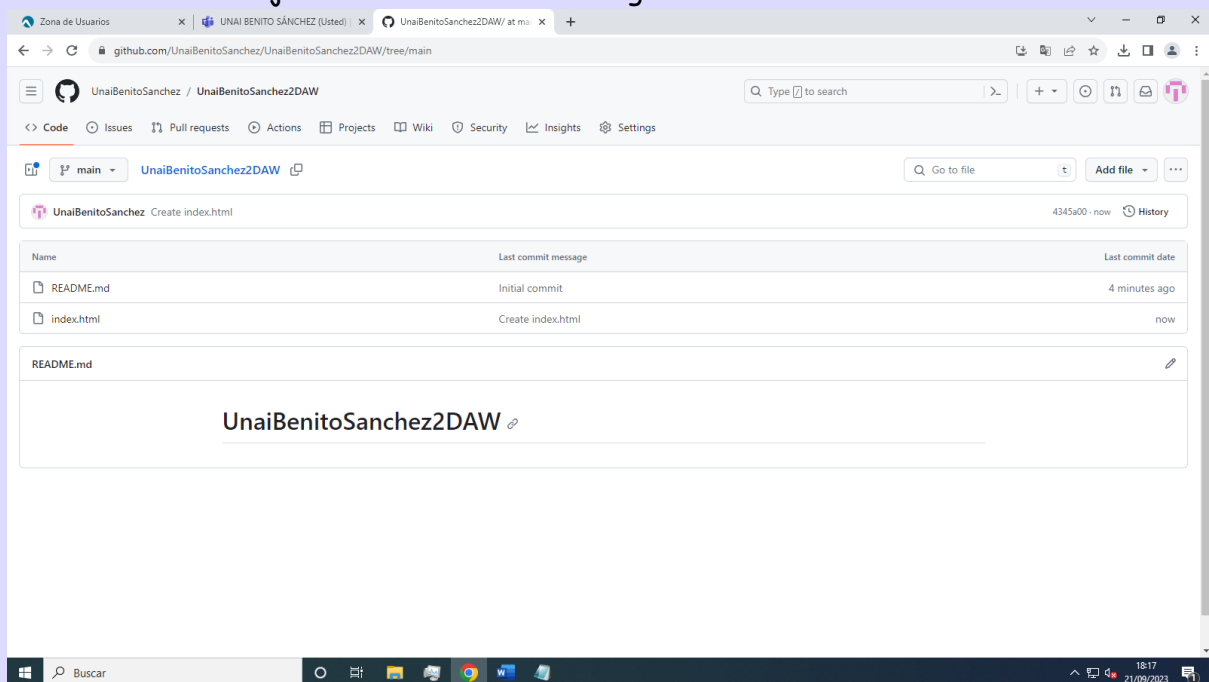

We should go to our repository, click on "Add file" and then on "Create new file"

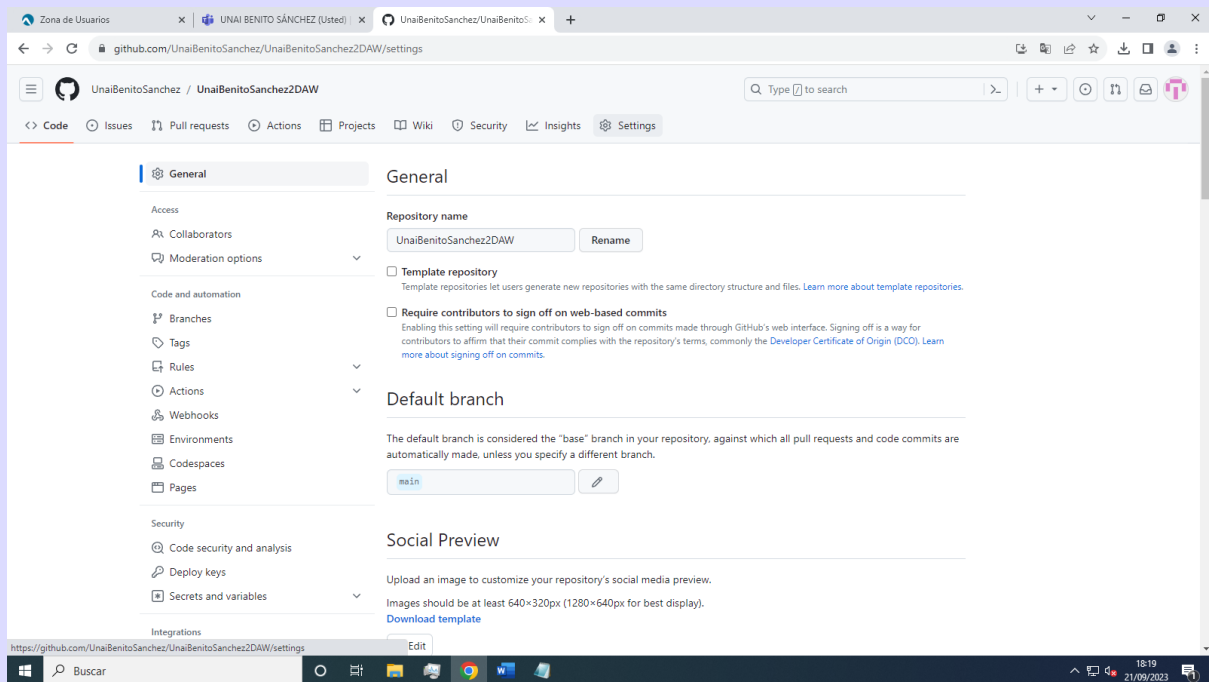

Then we should create the "index.html".

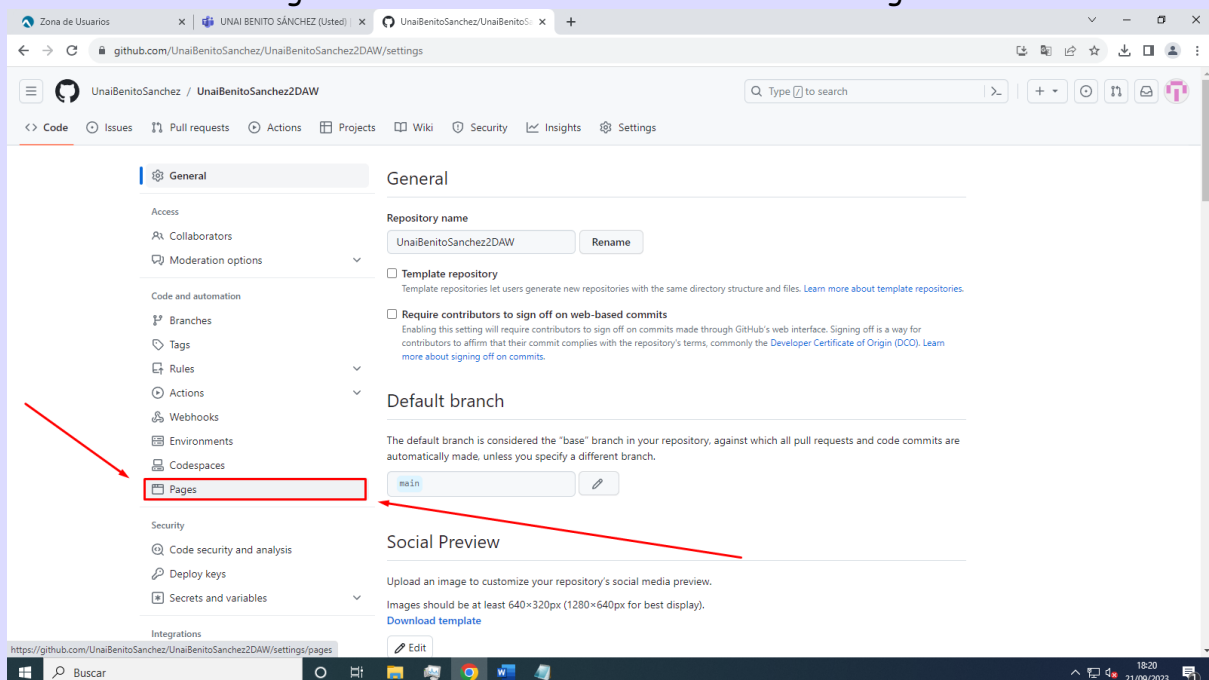

And now we should just click on "Commit changes".

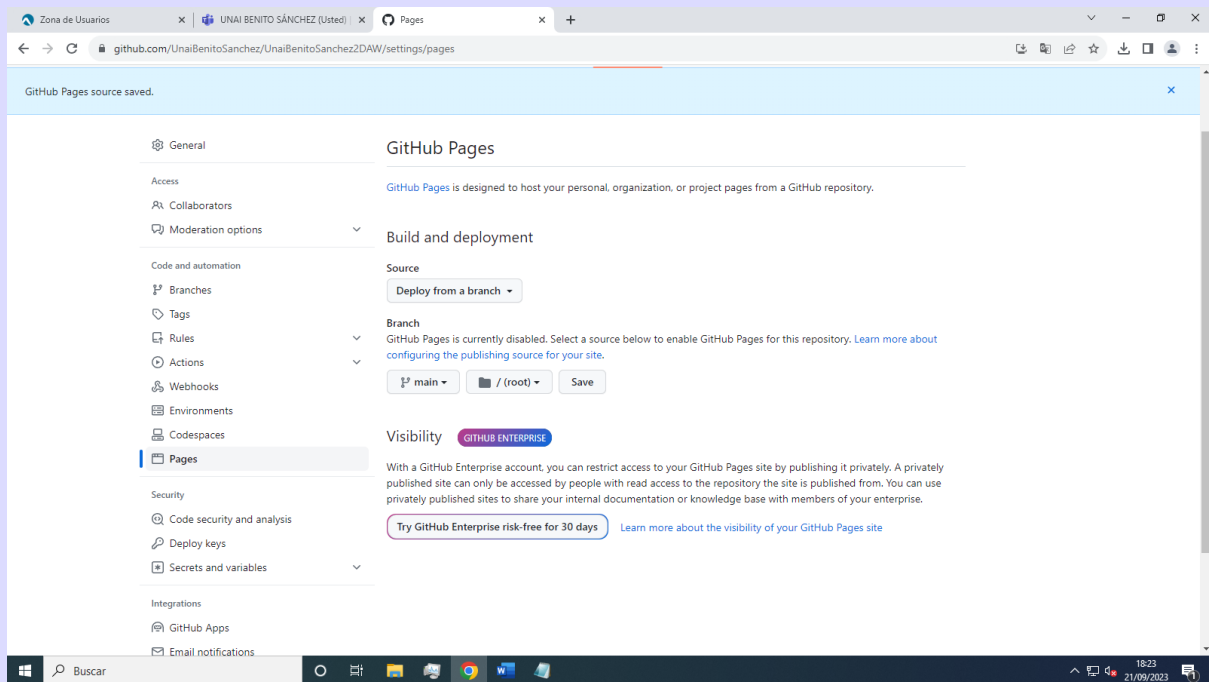

Now we should click on "Settings".

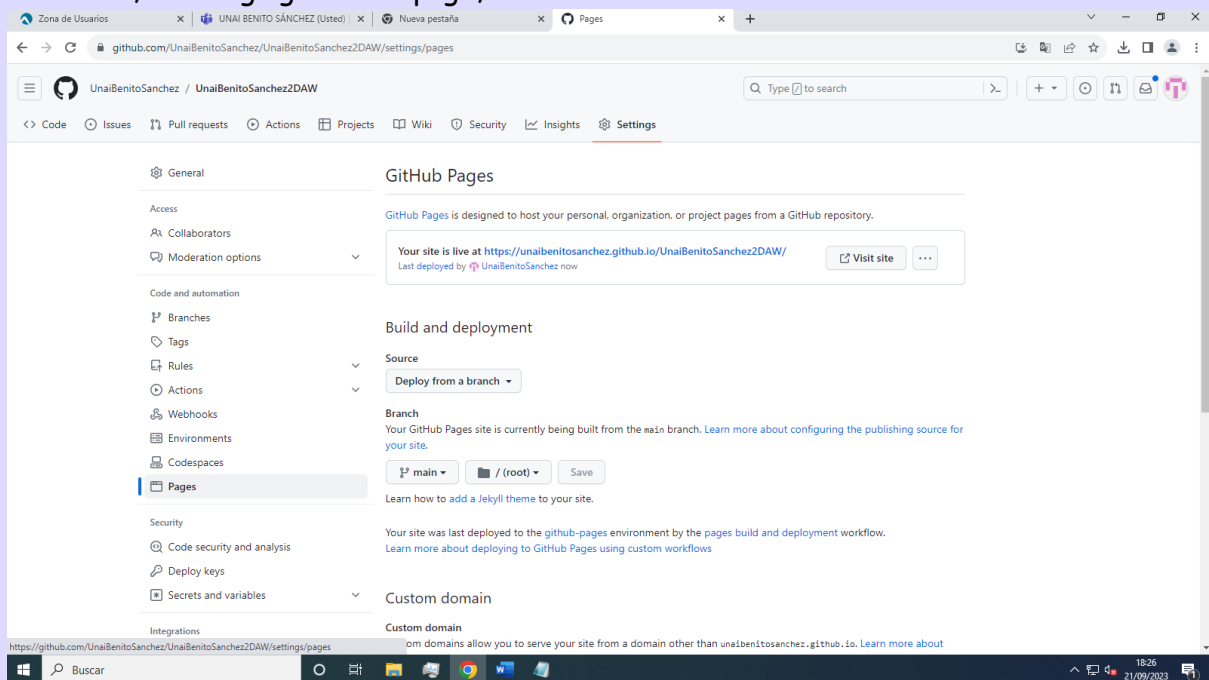

Now here we should go to "Code and automation" and click on "Pages".

In "Pages" we should select in "Build and deployment" the Branch where our index.html is, in this case, in the Branch "main" and click on "Save".

And then, recharging the webpage, it should look like this:

And then we just click on "Visit site" and we can see the web page.
